Motoring the  
Wheels of Success

CE

# INTRODUCTION

## APPLICATION:

"Hindustan" brand crane duty motors are specially designed for frequent starts/stops & reversing required in cranes & lifts of all types. They can also be used in applications such as material handling, weirs & sluices, auxiliary motors in rolling mills or wherever intermittent drives are required.

## RANGE:

KW	: 0.18 to 30.0 kW
RPM	: 1500, 1000, 750
Mounting	: Foot (B3), flange (B5), face (B14) & combinations
Frame	: 71 to 200L
Voltage	: 415V $\pm$ 10% or as required
Frequency	: 50Hz $\pm$ 5% or as required
Ambient	: 40°C. For motors other than this, a deration factor is applied as per Fig. 1
Altitude	: upto 1000m above m. s. l.
Rotor type	: Squirrel cage aluminium die cast
Enclosure	: Totally enclosed fan cooled (TEFC)
Protection	: IP55
Insulation class	: Class F insulation with temp. rise limited to class B
Duty cycle	: S3 – S5
Standards	: IS: 325, IS: 1231, IS: 2223 & IS: 4722

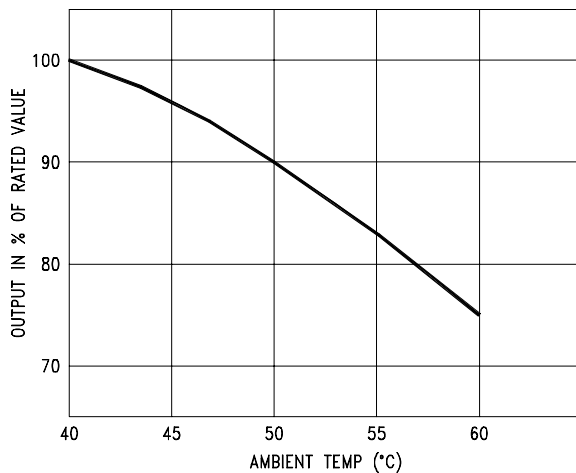

Fig. 1: Deration factor

Ambient temp.	Deration factor
45°C	0.96
50°C	0.90
55°C	0.83
60°C	0.75

## CONSTRUCTION:

**Castings:** "Hindustan" crane duty motors' housings & endshields are made from high quality castings as per IS: 210. All components are machined to correct accuracy & alignment.

**Stampings:** The stampings are made from low loss high permeability steel.

**Terminal Box:** Standard location of terminal box is on top. However the terminal box on right or left side can be provided on request. The terminal box can be rotated in steps of 90° in each position.

## MOTORS WITH INTEGRAL BRAKES:

These motors can be supplied with integral electromagnetic DC fail safe brakes with built in rectifiers.

## FLAMEPROOF MOTORS:

"Hindustan" crane duty motors are also available with flameproof enclosures.

## ENQUIRY DETAILS:

When placing an enquiry, please furnish the following details;

- Application details
- Motor power & speed
- Voltage & frequency variations
- Mounting
- No. of start/stops per hour with duty & CDF
- Load GD<sup>2</sup> at motor speed
- Load torque or torque/speed curve of driven equipment
- Duty cycle diagram if other than those described herein

## DEFINITIONS:

The terms frequently used in the intermittent duty drives are as follows;

1. **Duty:** Operation of the motor at load including no load & de-energised period to which the motor is subjected including the sequence & duration.
2. **Cyclic Duration Factor (CDF):** The ratio between the period of loading including starting & electric braking and the duration of the duty cycle expressed as percentage.
3. **Starting:** The process of energizing a motor to bring it upto its rated speed from rest.
4. **Electric Braking:** A system in which a braking action is applied to an electric motor by causing it to act as a generator.
5. **Regenerative Braking:** A system of electric braking in which energy is returned to the supply system.
6. **D C Injection Braking:** A form of braking of an induction motor in which a separate DC supply is used to magnetise the motor.
7. **Plugging:** A form of braking of an induction motor obtained by reversing the phase sequence of its any two lines.

## DUTY TYPES:

**Intermittent Periodic Duty (Duty Type S3):** A sequence of identical duty cycle, each consisting of a period of operation at constant load & a rest period. These periods being too short to attain thermal equilibrium during one duty cycle. In this duty type, the starting current does not significantly affect the temperature rise. (Fig. 3)

Unless otherwise specified, the duration of the cycle is 10 min. The recommended values for the load factor are 15, 25, 40 & 60 percent.

$$CDF = N/(N+R)$$

Fig. 3: Intermittent Periodic Duty, Duty Type S3

**Intermittent Periodic Duty with Starting (Duty Type S4):** A sequence of identical duty cycles each consisting of a period of starting, a period of operation at constant load & a rest period. The operating, rest & de-energised periods being too short to attain thermal equilibrium during one cycle. (Fig. 4)

In this duty the stopping of the motor is obtained either by natural deceleration after disconnection of the electric supply or by means of braking such as a mechanical brake which does not cause additional heating of the windings.

$$CDF = (D+N)/(D+N+R)$$

Fig. 4: Intermittent Periodic Duty with Starting, Duty Type S4

**Intermittent Periodic Duty with Starting & Braking (Duty Type S5):** A sequence of identical duty cycles each consisting of a period of starting, a period of operation at constant load, a period of braking & a rest period. The operating, rest & de-energised periods being too short to attain thermal equilibrium during one cycle. In this duty, braking is rapid & is carried out electrically. (Fig. 5)

Note: In all the above type of duties, the loading duration & the idling duration of the cycle are so short that the steady state temp. is not reached. While working on these identical cycles continuously, the motor temp. rise must not exceed the permissible values.

$$CDF = (D+N+F)/(D+N+F+R)$$

Fig. 5: Intermittent Periodic Duty with Starting & Electric braking, Duty Type S5

- D = Starting
- N = Operation under rated condition
- F = Electric braking
- R = At rest & de-energised
- $\theta_{max}$  = Max. temp attained during the duty cycle
